CHECKPOINT 3 – PROGRESS NOTE

Marketplace Revenue and Delivery-Performance Pipeline | Team 6

GitHub repository: https://github.com/jayesh05bablr-code/Marketplace-Revenue-Delivery-Performance-Pipeline

Workspace progress

The Databricks Workspace screenshot supplied for this update shows the project folder Team6_Marketplace_Revenue_Delivery_Pipeline containing six notebooks:

01_Bronze_Layer_Ingestion
02_Silver_Layer_Transformation
03_Data_Modeling
04_Data_Quality_Validation
05_Gold_Layer_Analytics
06_Dashboard_Insights

Project pipeline scope

The six notebooks are organised as a Bronze–Silver–Gold pipeline. Notebook 01 is intended for ingestion of the nine Olist CSV datasets into Bronze Delta tables with source metadata. Notebook 02 is intended for cleaning and standardisation. Notebook 03 is intended to create the order-item fact table and customer, seller, product and date dimensions. Notebook 04 is intended to validate data quality. Notebook 05 is intended to create business-level Gold aggregates. Notebook 06 is intended to query Gold outputs and prepare dashboard insights.

GitHub repository status

The project repository URL was supplied by the team and checked during preparation of this note. The repository is public and its main branch currently displays a README.md file containing only the repository heading. The repository listing does not currently show the six exported Databricks notebooks or the Agile and progress-note PDFs. These files still need to be committed and pushed if they are to form part of the GitHub submission.

Checkpoint 3 focus

The DigiCampus assignment description requests a Git repository with notebook code for data transformation and a write-up on the Agile approach to the Big Data project. The immediate submission focus is therefore the implemented transformation notebook code, particularly Bronze ingestion and Silver transformation, together with the Agile Approach PDF.

Verification and next actions

The Workspace screenshot confirms notebook creation and naming, but it does not prove successful notebook execution. Execute the relevant cells, resolve errors, verify table creation and row counts, and retain output evidence. Export the implemented notebooks as .ipynb files, add them and the PDFs to the GitHub repository, update README.md, and submit the required files through DigiCampus.

Status qualification: this note distinguishes notebook creation from successful execution and distinguishes the Databricks Workspace listing from the current GitHub repository contents. Update it after the repository is populated and execution checks are complete.
